VM Emulator Tutorial

This program is part of the software suite that accompanies the book

The Elements of Computing Systems

by Noam Nisan and Shimon Schocken

MIT Press

www.nand2tetris.org

This software was developed by students at the Efi Arazi School of Computer Science at IDC

Chief Software Architects: Yaron Ukrainitz and Yannai Gonczarowski

Background

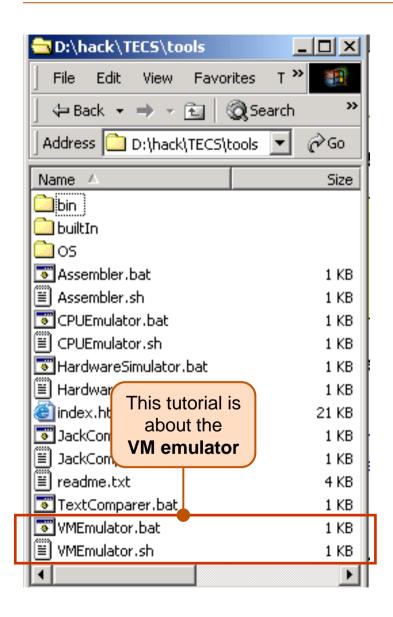

The Elements of Computing Systems evolves around the construction of a complete computer system, done in the framework of a 1- or 2-semester course.

In the first part of the book/course, we build the hardware platform of a simple yet powerful computer, called Hack. In the second part, we build the computer's software hierarchy, consisting of an assembler, a virtual machine, a simple Java-like language called Jack, a compiler for it, and a mini operating system, written in Jack.

The book/course is completely self-contained, requiring only programming as a pre-requisite.

The book's web site includes some 200 test programs, test scripts, and all the software tools necessary for doing all the projects.

The Book's Software Suite

(All the supplied tools are dual-platform: Xxx.bat starts Xxx in Windows, and Xxx.sh starts it in Unix)

Simulators

(HardwareSimulator, CPUEmulator, VMEmulator):

- Used to build hardware platforms and execute programs;
- Supplied by us.

Translators (Assembler, JackCompiler):

- Used to translate from high-level to low-level;
- Developed by the students, using the book's specs; Executable solutions supplied by us.

Other

- Bin: simulators and translators software;
- builtin: executable versions of all the logic gates and chips mentioned in the book;
- os: executable version of the Jack OS:
- TextComparer: a text comparison utility.

VM Emulator Tutorial

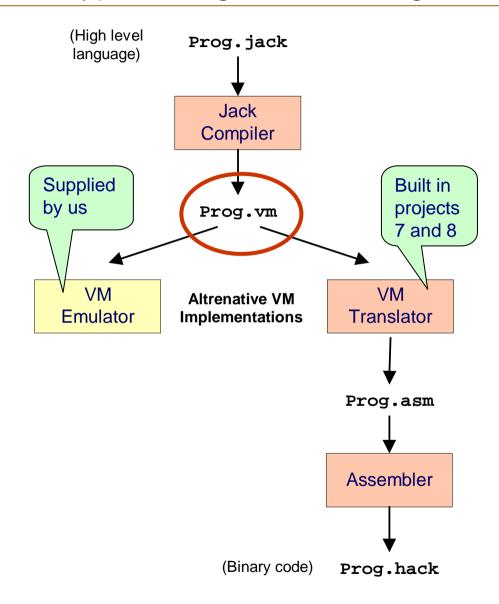

- Getting Started
- II. <u>Using Scripts</u>
- III. Debugging

Relevant reading (from *The Elements of Computing Systems*):

- Chapter 7: Virtual Machine I: Stack Arithmetic
- Chapter 8: Virtual Machine II: Program Control
- Appendix B: Test Scripting Language, Section 4.

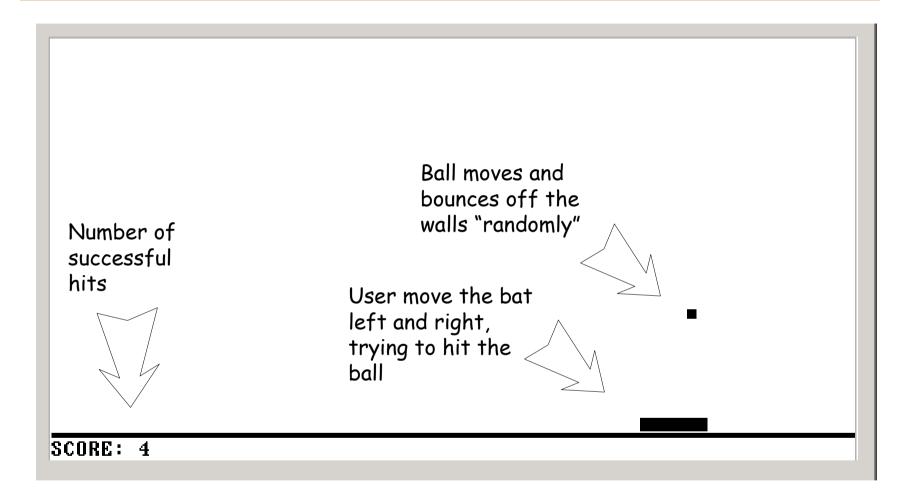

The Typical Origin of VM Programs

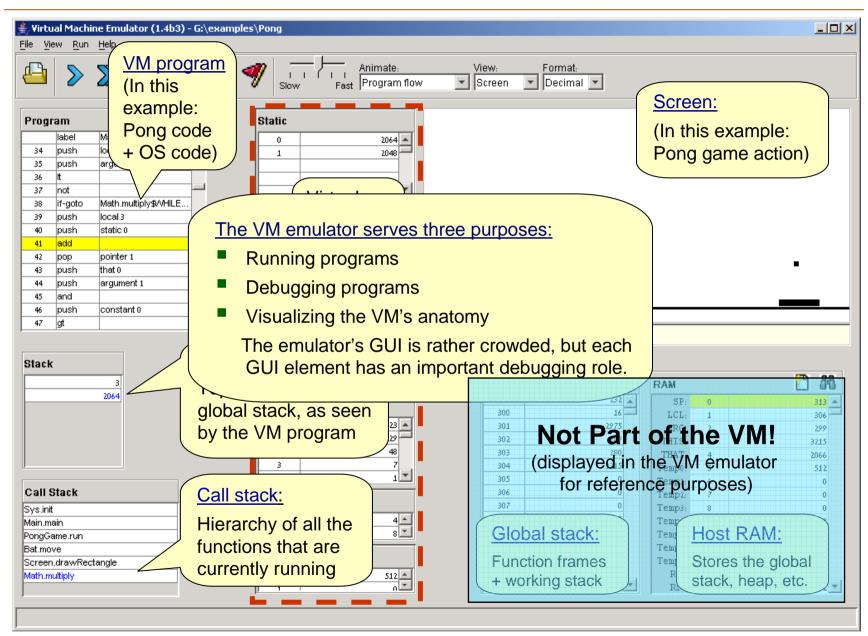

- VM programs are normally written by compilers
- For example, the Jack compiler (chapters 10-11) generates VM programs
- The VM program can be translated further into machine language, and then executed on a host computer
- Alternatively, the same VM program can be emulated as-is on a VM emulator.

Example: Pong game (user view)

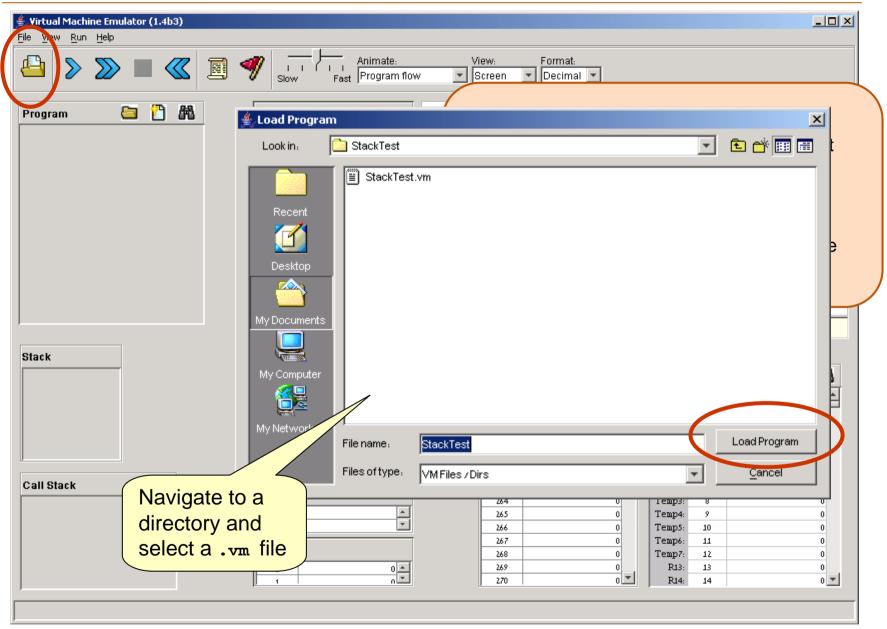

Now let's go behind the scene ...

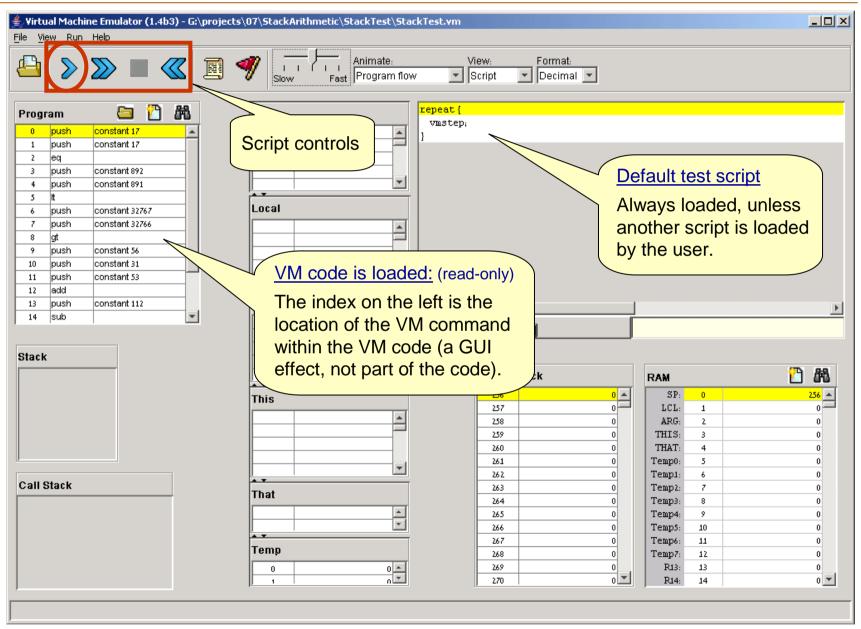

VM Emulator at a Glance

Typical VM Script

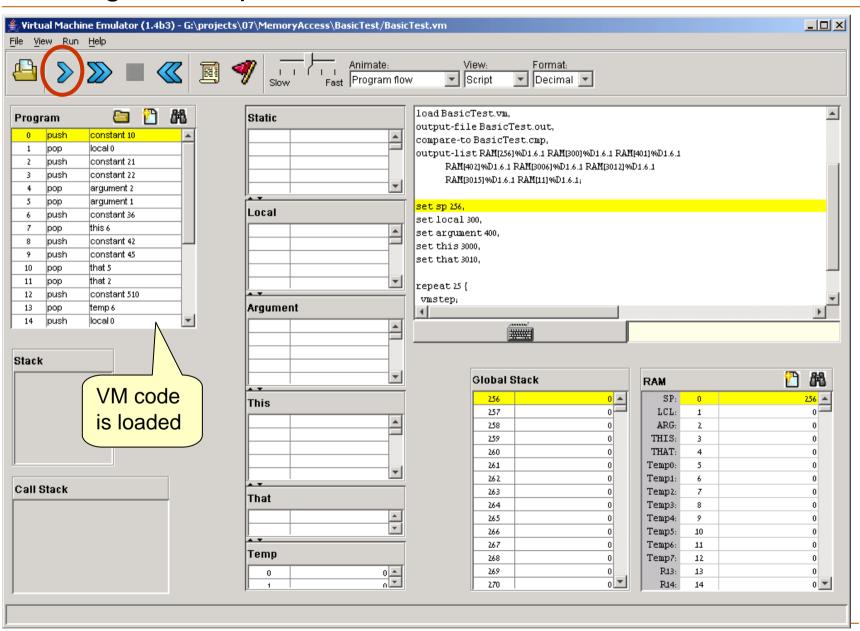

```
load BasicTest.vm,
                    output-file BasicTest.out,
                                                                  Typical "script setup"
 Simulation step
                    compare-to BasicTest.cmp,
                                                                 commands
(a series of script
                    output-list RAM[256]%D1.6.1
    commands
                            RAM[300]%D1.6.1 RAM[401]%D1.6.1
  ending with a
                            RAM[402]%D1.6.1 RAM[3006]%D1.6.1
    semicolon)
                            RAM[3012]%D1.6.1
                            RAM[3015]%D1.6.1 RAM[11]%D1.6.1;
                    set sp 256,
                                                                Typical memory
                    set local 300,
                                                                segments initialization
         Next
                    set argument 400,
                                                                commands
     simulation
                    set this 3000,
         step
                    set that 3010;
                    repeat 25 {
     Repeated
                      vmstep,
     simulation
                                                                Typical execution loop
         step
                       output;
```

Breakpoints: a Powerful Debugging Tool

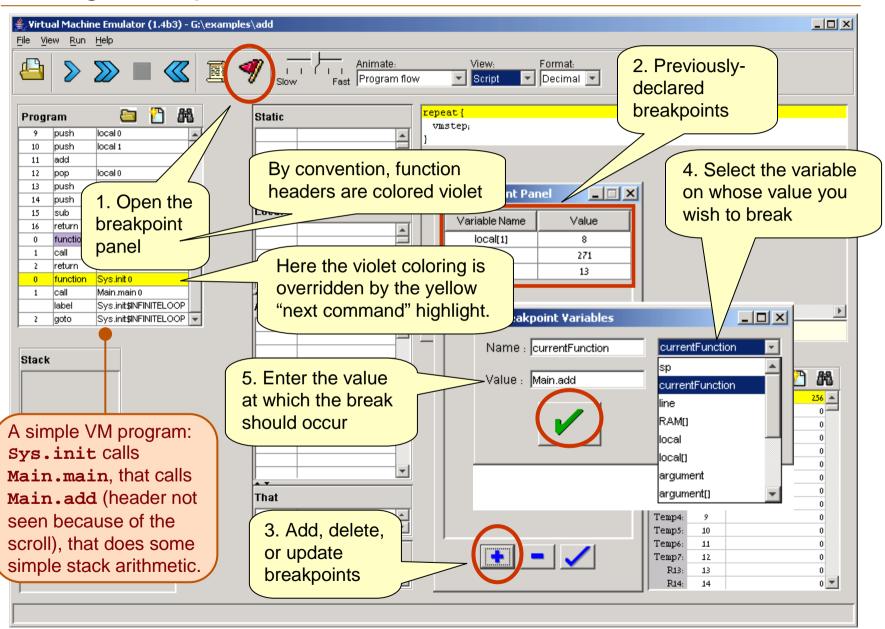

The VM emulator keeps track of the following variables:

- segment[i]: Where segment is either local, argument, this, that, or temp
- local, argument, this, that: Base addresses of these segments in the host RAM
- RAM[i]: Value of this memory location in the host RAM
- sp: Stack pointer
- currentFunction: Full name (inc. fileName) of the currently executing VM function
- line: Line number of the currently executing VM command

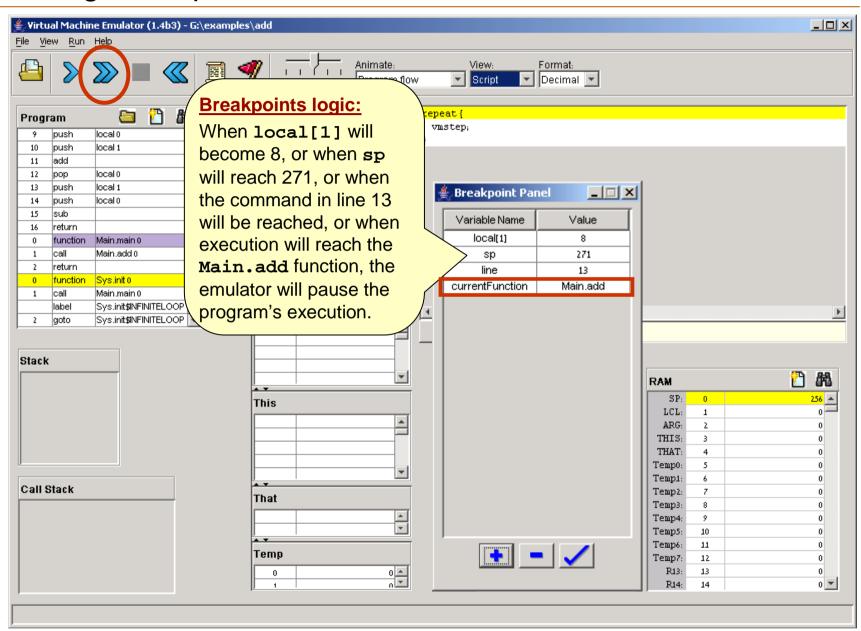

Breakpoints:

- A breakpoint is a pair < variable, value> where variable is one of the labels listed above (e.g. local[5], argument, line, etc.) and value is a valid value
- Breakpoints can be declared either interactively, or via script commands
- For each declared breakpoint, when the variable reaches the value, the emulator pauses the program's execution with a proper message.

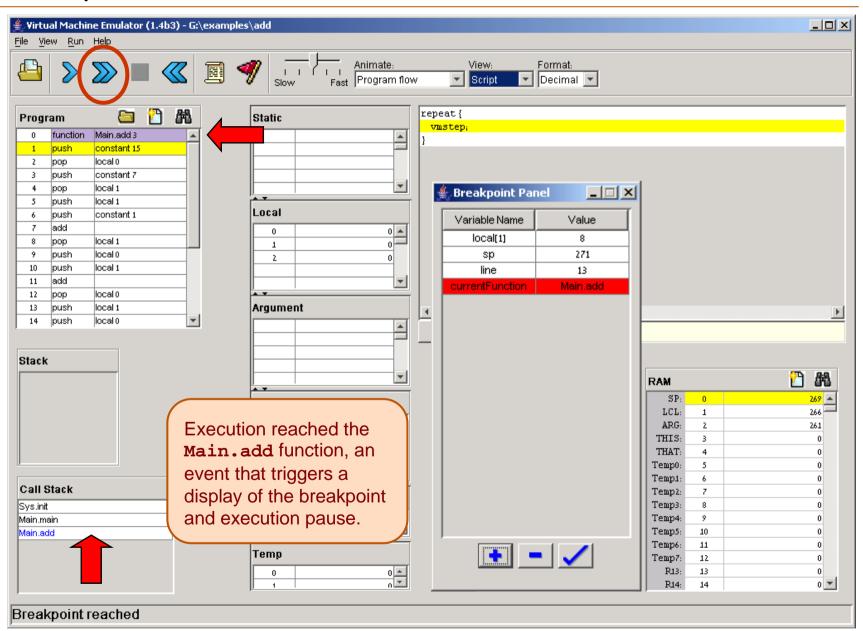

Setting Breakpoints

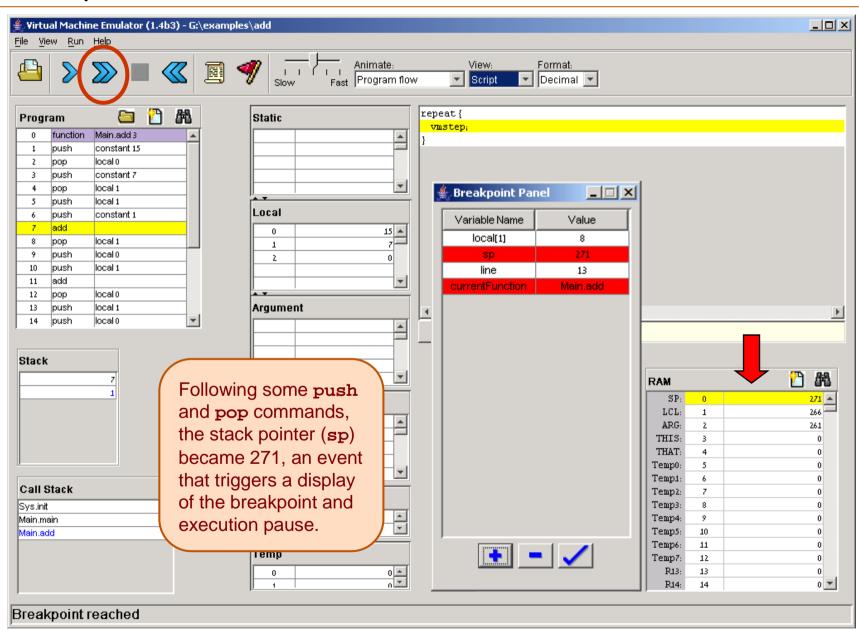

Setting Breakpoints

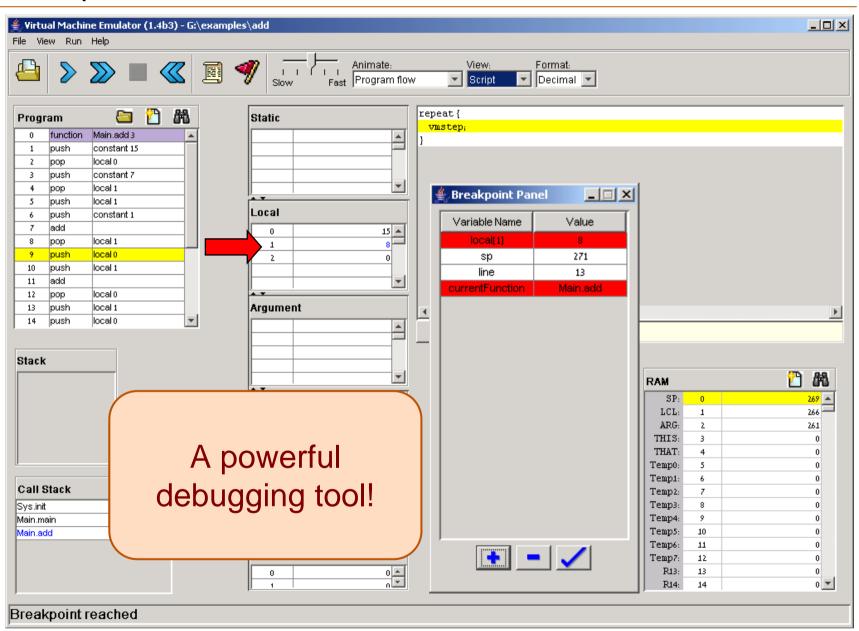

Breakpoints in Action

Breakpoints in Action

Breakpoints in Action

Breakpoints in Scripts

```
load myProg.vm,
output-file myProg.out,
output-list sp%D2.4.2
            CurrentFunction%S1.15.1
            Argument[0]%D3.6.3
            RAM[256]%D2.6.2;
breakpoint currentFunction Sys.init,
set RAM[256] 15,
set sp 257;
repeat 3 {
  vmStep,
output;
while sp < 260 {
  vmstep;
output;
clear-breakpoints;
// Etc.
```

- For systematic and replicable debugging, use scripts
- The first script commands usually load the .vm program and set up for the simulation
- The rest of the script may use various debugging-oriented commands:
 - Write variable values (output)
 - Repeated execution (while)
 - Set/clear Breakpoints
 - Etc. (see Appendix B.)

End-note on Creating Virtual Worlds

"It's like building something where you don't have to order the cement. You can create a world of your own, your own environment, and never leave this room."

(Ken Thompson, 1983 Turing Award lecture)

Ken Thompson (L) and Dennis Ritchie (R)
